

## LISTENING

## #23

1 – You will listen to a speaker explaining what machine learning is, the different types of machine learning, its concepts, plus some real-world applications. Pay attention to how the speaker defines each type, gives examples, and explains it

## Machine Learning

1 - What is machine learning described as in the audio?

- a) A part of AI that helps computers learn from data
- b) A way for humans to learn new sports
- c) A type of mobile phone

2 - How many main types of machine learning does the speaker mention?

- a) One
- b) Two
- c) Three

3 - Name a task that is an example of supervised learning.

---

4 - In unsupervised learning, what is the computer trying to do?

- a) Find hidden patterns in data
- b) Follow spoken instructions
- c) Copy a teacher step by step

5 - In which area is reinforcement learning often used?

---

6 - What is the role of the training set?

- a) To help the computer learn from data
- b) To judge the computer's final score
- c) To delete incorrect answers

7 - What can happen if a model learns the training data too well?

- a) It becomes bad at working with new data
- b) It becomes perfect forever
- c) It stops learning anything

8 - Name one real-life application of machine learning mentioned in the audio.

---

9 - Name one area where machine learning is used in real life.

---

Full Name \_\_\_\_\_

## READING COMPREHENSION

### Machine Learning Examples and Applications

Machine learning (ML) is increasingly integrated into many industries to help identify patterns and support data-driven decisions. As a branch of artificial intelligence (AI), ML methods use algorithms to analyze training data and then apply what they learn to new, unseen cases.

Healthcare is one of the most prominent areas of ML adoption. ML systems can examine large sets of medical records, detect unusual patterns, and support early diagnosis—from identifying diseases to estimating severity. In the financial sector, ML is widely used for fraud detection: algorithms monitor user behavior and flag transactions that differ significantly from a customer's normal activity.

Manufacturing and automation also benefit from machine learning. Companies use ML tools to optimize supply chains, perform predictive maintenance on equipment, and improve operational efficiency. Education is another area experiencing change, with ML-powered adaptive platforms that personalize lessons by analyzing students' progress and recommending tailored learning pathways.

These applications rely on well-established ML principles. A solid model learns from a training set and is then evaluated on a separate test set. When a model is too simple, it underfits and fails to capture meaningful patterns; when it becomes overly complex, it overfits and performs poorly on new data. Feature selection (choosing the most relevant inputs) and feature engineering (creating new features from existing data) both help improve how well a model performs.

In short, machine learning is no longer limited to research labs. It is driving transformation across many sectors by turning raw data into actionable insights. Understanding both the potential and limitations of ML is essential for using it effectively and responsibly.

### Comprehension Questions

1. What is one primary reason machine learning is being adopted by many industries?

\_\_\_\_\_

2. Which industry is mentioned as using ML to estimate the severity of diseases?

\_\_\_\_\_

3. How can machine learning help companies in manufacturing and automation?

\_\_\_\_\_

4. Do you think your school or workplace could use machine-learning tools to improve performance? Explain how.

\_\_\_\_\_

\_\_\_\_\_

5. How do you personally feel about systems making decisions based on your data? Would you trust them? Why or why not?

\_\_\_\_\_
